Subject: Benfluralin (Benefin) on small seeded legumes

Follow Up Flag: Follow up
Flag Status: Red

Dear Jane,

I just received the following e-mail from Harold Coble requesting information on Balan. I have not been able to get a due date yet, but I have left a message for one.

We don't have a lot of use on alfalfa in CA, but it is important on lettuce.

Please initiate contacts and see what you can find out.

Thanks.

Rick

HELP!!

EPA is in the process of risk assessment of benfluralin (benefin, trade name Balan).

I need any info you can find on benfluralin use on small-seeded legumes, particularly alfalfa. It is the only grass material I know of that can be used in establishment of small-seeded legumes. Typical info is needed - where it is used, how much, etc.

thanks,

Harold
